**HOW TO CUT EARMOLD TUBING TO FIT**

The earmold will come with extra tubing attached. Follow these steps to cut the tubing to the correct length.

**Step 1:** Have patient put the earmold (with the extended tubing) into the ear.

**Step 2:** Hang the hearing aid on the ear. The extra tubing should point up and extend past the earhook of the hearing aid.

**Step 3:** With a marker or pen, mark a dot on the earmold tubing that is at least ¼ inch above the tip of the earhook. It is better to cut the tubing too long than too short.

**Step 4:** Cut the tubing with sharp scissors.

**Step 5:** Attach the hearing aid earhook to the tubing making sure that you push (wiggle) the tubing at least ¼ inch up the earhook. This will help hold it in place.

**Remember:** If you cut the tubing too long, you can always trim it. If you cut the tubing too short, the earmold may need to be re-tubed by the audiologist. If you need help, please call 502-596-1040 option 2.
